**Problem Statement:**

You are required to create an angular 7+ project (country details) with the following details:

- The app would consist of 3 modules namely
  - a. **Home/ Country Details (default page)**
    - This is the default page to be loaded on app initialisation.
    - Country select box in top bar and left hand side menu is visible on all the pages.
    - Only the detail container will change on any route hit.
    - Country select box will be loaded with all the country names fetched from the countries API (link in resources) on page load and when a country is selected, the subsequent details page will load the corresponding data of the selected country.
    - Pass the `alpha3Code` value of selected country to fetch the details by calling the REST API
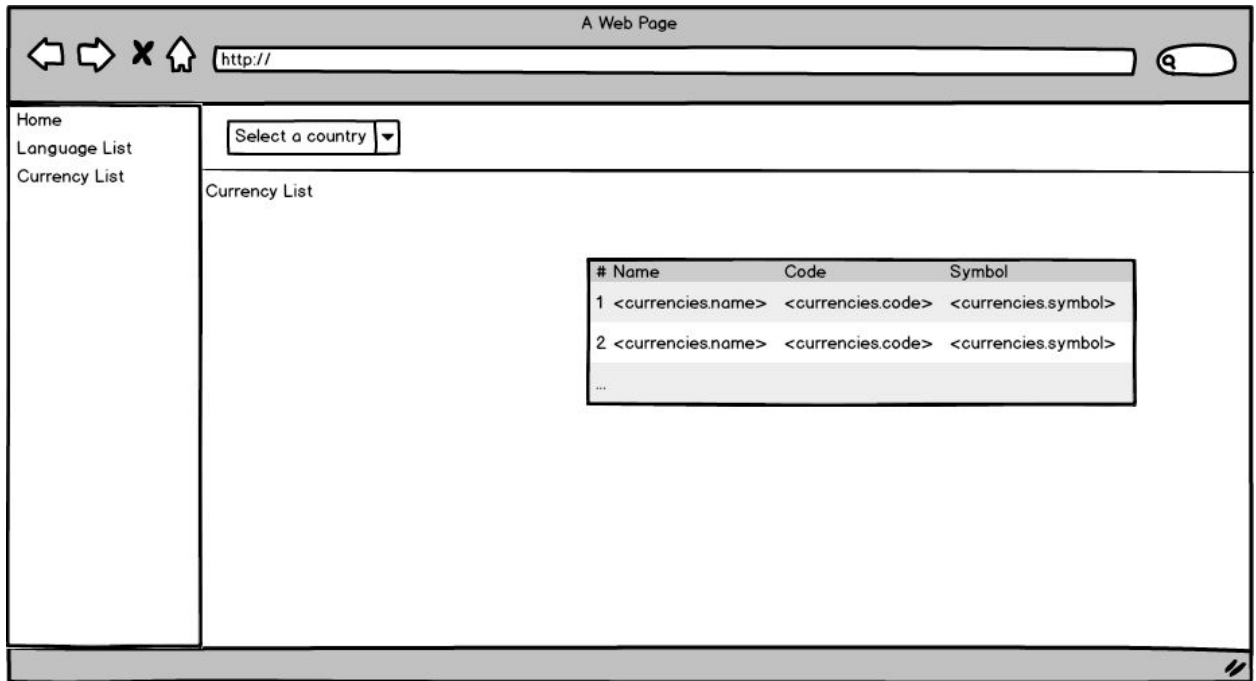

b. Language List

- This page will load the language list of the selected country in top bar select box
- Please note that we can change the country selection on any page and on change of the selected country, the corresponding details must be loaded from API (listed below)
- This module has to be **lazily loaded** on click of its menu
- Pass the `alpha3Code` value of selected country to fetch the details by calling the REST API

A Web Page

http://

Home
Language List
Currency List

Select a country ▼

Language List

# Name	Native Name
1 <languages.name>	<languages.nativeName>
2 <languages.name>	<languages.nativeName>
...	

c. **Currency List**
- This page will load the currency list of the selected country in top bar select box
- Please note that we can change the country selection on any page and on change of the selected country, the corresponding details must be loaded from API (listed below)
- This module has to be **lazily loaded** on click of its menu
- Pass the `alpha3Code` value of selected country to fetch the details by calling the REST API

- You are required to use the following **resources** in order to speed up the implementation
  a. Theme/ boilerplate (Comes with bootstrap 4 built-in) - https://github.com/coreui/coreui-free-angular-admin-template
  b. Countries REST API (Link)
     - Country List - `https://restcountries.eu/rest/v2/all`
     - Language and Currency List - `https://restcountries.eu/rest/v2/alpha/<alpha3Code>`

Guidelines:
- Please upload the completed the assignment on your GitHub account and send us the link to your repository for review (No need to host/deploy the project)
- All the assumptions/instructions to run the project must be mentioned in the readme file
- Please remove all the unnecessary code files from the theme and keep only the required ones

Evaluation Details:

- Working state. Non-working or partially working project entries would be rejected
- Code Quality
- Comment wherever required
- Use of latest standards such as ES6
- More emphasis will be given in achieving the task rather than on the UI
